The study of core-excited component in 11Li

Wednesday, 8 March 2023 14:10 (5 minutes)

¹¹Li nucleus is one of the flagship drip-line nuclei in the field of nuclear physics. A spatially extended structure of neutrons in ¹¹Li, which is now widely known as "halo" structure, opened the very active field of research with unstable nuclear beams. ¹¹Li have the nature of Borromean.[1] In many cases, ¹¹Li is considered as a 3-body system of ⁹Li + 2 neutrons. However, recent theoretical studies pointed out that contribution of the excited ⁹Li core can be significant. According to the interpretation of [2], the ground state of ¹¹Li has components which contain excited state of the core. In Ref [3], they showed that the E1 cluster sum rule value should be reduced by about 15% due to the ⁹Li core excitation. Currently no experiment has succeeded in providing a direct information of the excited ⁹Li core in ¹¹Li.

In this work, with the data of SAMURAI18 experiment, the quasi-free 11 Li(p,pn) 9 Li* reaction was employed to study the excited 9 Li core. Because of spin-parity constraints, the first bound excited state of 9 Li cannot contribute much and the 2nd state, which is unbound, can give the major contribution. Therefore, the 9 Li excited core will decay into the 8 Li + neutron. After eliminating most of CrossTalk events, using the invariant mass spectrum and dalitz plot of 8 Li + 2 neutrons, we could get the direct information of the exited 9 Li core in 11 Li.
