## Towards inverse modeling problems in nuclear physics

Monday, 26 August 2019 17:25 (15 minutes)

Recent developments in nuclear potentials based on chiral effective field theory and in various ab-initio approaches have enlarged our microscopic understandings to a wide range of nuclear chart including doubly open-shell nuclei.

However, is it enough to consider only those bottom-up approaches for making reliable predictions about exotic nuclei for which experimental verification is extremely difficult?

In this talk, I will explain importance of so-called "inverse modeling problems" and the preprocessing towards inverse modeling problems, that is, uncertainty quantification of theoretical predictions, by taking recent publications as examples.
